I finally found how to fix this. I extracted the installation script from the RPM file and I looked for the part where it would search for zlib:

if [!-f/usr/lib/libz.so.1]; then ZLIB=1 echo The zlib package or binaries are missing! echo Please install the zlib-1.1.4 RPM package. fi if [["\$ZLIB" = '1' || "\$EXPT" = '1']]; then echo Required Packages are missing! exit 1 fi

The script is looking for "libz.so.1" in "/usr/lib", but CentOS 6 installs this library in "/lib/". I made a symbolic link with the following command and everything works now:

In -s /lib/libz.so.1.2.3 /usr/lib/libz.so.1

In my previous Scientific Linux 6 setup, the symbolic links must have been already there with the default installation, I don't know if it's a bug in the zlib packages from CentOS or in HP's installation script. Anyway, I hope it will help others if they run into the same problem!

Thanks!
