The best repo for Multimedia is probably RPMforge although some prefer ATrpms.

I don't see gst-plugins-ugly anywhere.

yum --noplugins --showduplicates --enablerepo * --disablerepo c6-media,*debug*,*-source list *ugly
Available Packages gstreamer-plugins-ugly.x86_64 0.10.16-2.el6.rf rpmforge
gstreamer-plugins-ugly.x86_64 0.10.18-14.el6 atrpms

Before proceeding please read about Installing Software and Repositories, and note the warnings and advice about installing and configuring the yum priorities plugin. Non-core repos should have a higher numeric value, which is a lower priority. Lower is "better" as in golf scores.

EPEL, RPMforge, and ATrpms do not play well together. Not so sure about RPMfusion as I don't use them, but only their -testing repos seem to be populated and you probably need the non-free repos as well if you want to use them for DVD support.
yum --noplugins --showduplicates --disablerepo * --enablerepo rpmfusion* repolist repo id
repo name status rpmfusion-free-updates RPM Fusion for EL
