Owing the domain name and having it resolvable via DNS are two different issues. The ISP or **somebody** outside your local network has to provide the mapping from FQDN to public IP address.
$ host zanda.com Host zanda.com not found: 3(NXDOMAIN) $ host centos.org centos.org has address 72.232.194.162 centos.org mail is handled by 10 mail.centos.org.

Well I went back through bind again, and I think I'm getting it, I'm not sure though.
When bringing it up now I'm getting: Error 137 (net::ERR_NAME_RESOLUTION_FAILED): Unknown error.

I'm using this guide;http://www.howtoforge.com/bind-installation-on-centos

Under step 7 it gives me ;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 0, ADDITIONAL: 0 when I'm supposed to be getting 1's under authority and additional

Do you know what could be causing this?
Unless it's still a problem with what you said above
