I still don't understand what's going on! Why do I download and install something that turns out not to have the required thing in its repository.

Let's get back to the basics. In #2 you were asked to provide the output from "./getinfo.sh package" but you haven't posted the results yet. Please download and run the script and post the results. It looks like you have excluded php and mysql from yum. Did you install this system by yourself?
